MYCA

Windows Workbench Guide for CA Review

The firm-side companion to the phone app: every tab of the Windows desktop, captured live with Nalanda Textiles LLP demo books, and what each proves to a reviewing CA.

Date	30 October 2026 — live captures from http://127.0.0.1:4789 with seeded demo books (INV-0001, INV-0002, BILL-0001)
Sources	platform/desktop/renderer (12 tabs) + keys.html sandbox page
Verification	Trial balance Dr = Cr on screen · Books tie · FY 2026-27
Scope	Firm-side flow: vouchers to books to GST to approvals to govt to print
Classification	Confidential — for review discussion only

How to use this guide: walk tabs left to right. Vouchers is where postings land; Books proves they tie; GST proves the return comes from the same invoices; Documents / Clients / Approvals / Firm prove control; Govt / APIs / Sandbox keys prove integrations stay gated; Print proves the invoice leaves the machine cleanly. OSS and Tools prove what the product refuses to embed.

1 The firm-side flow in one page

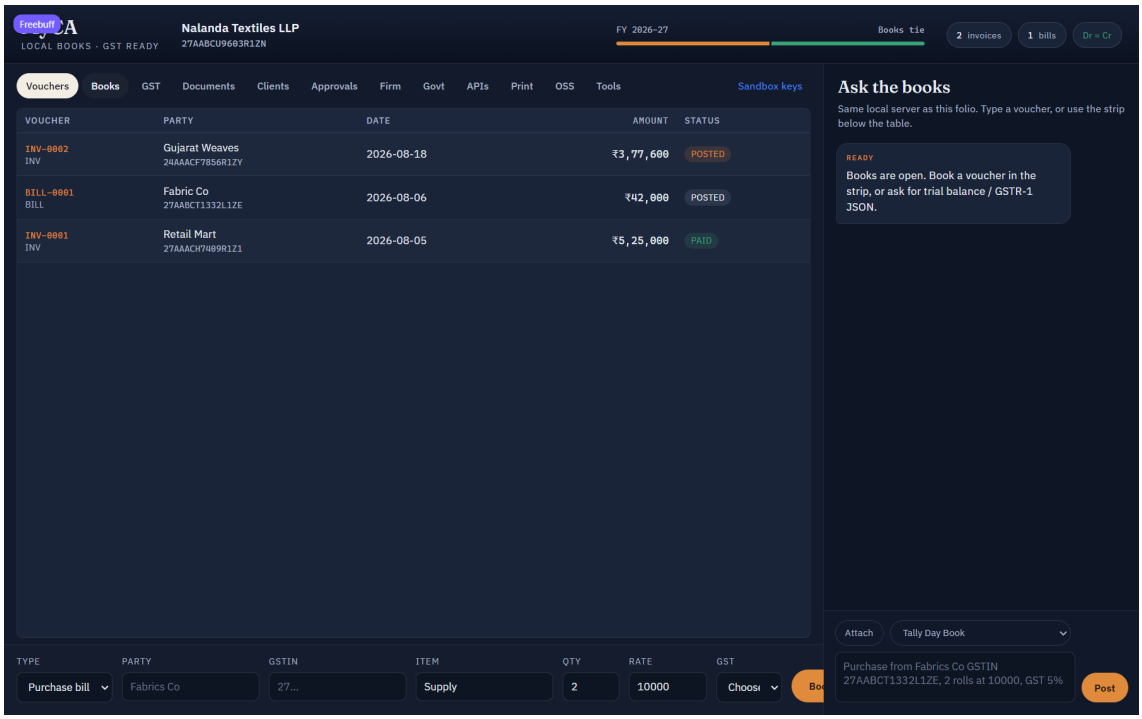

The Windows app is the firm's book of record. The phone proposes; the desktop reviews, reconciles, approves and prints. One local server serves both: chat, tools and the journal in **platform/src**, state in state.json, document bytes content-addressed on disk. Live provider calls stay off unless MYCA_ENABLE_LIVE_CALLS=1, and gated operations need a CA approval bound to the exact payload.

Stage	Tab	CA question answered
Post	Vouchers	Do invoices and bills land with party, GSTIN, date, amount and status — paid, posted, or held — in one folio?
Tie	Books	Do debit and credit tie, account by account, with the checksum intact?
Return	GST	Do B2B / B2CL / B2CS, ITC and payable come from the same invoices, held back with reasons where unreportable?
Evidence	Documents	Is every bill filed against the active client and retrievable byte-identical?
Scope	Clients	Whose books are these, and does switching isolate the ledger?
Control	Approvals	Who authorised a live operation, and is maker-checker enforced?

Stage	Tab	CA question answered
Identity	Firm	Whose GSTIN / PAN / state is the book, and can history be rewritten? (It cannot.)
Portal	Govt	Can this PC reach NIC/GSTN, and are credentials encrypted with the public key loaded?
Readiness	APIs	Which of REQ-CA-001…015 is connected, and what is honestly missing?
Output	Print	Does the invoice print and save as PDF with bank details, HSN and signatory?
Honesty	OSS	What is referenced, reimplemented or refused to embed — and under which licence?
Power	Tools	Which named tools exist, and which are blocked from the assistant?

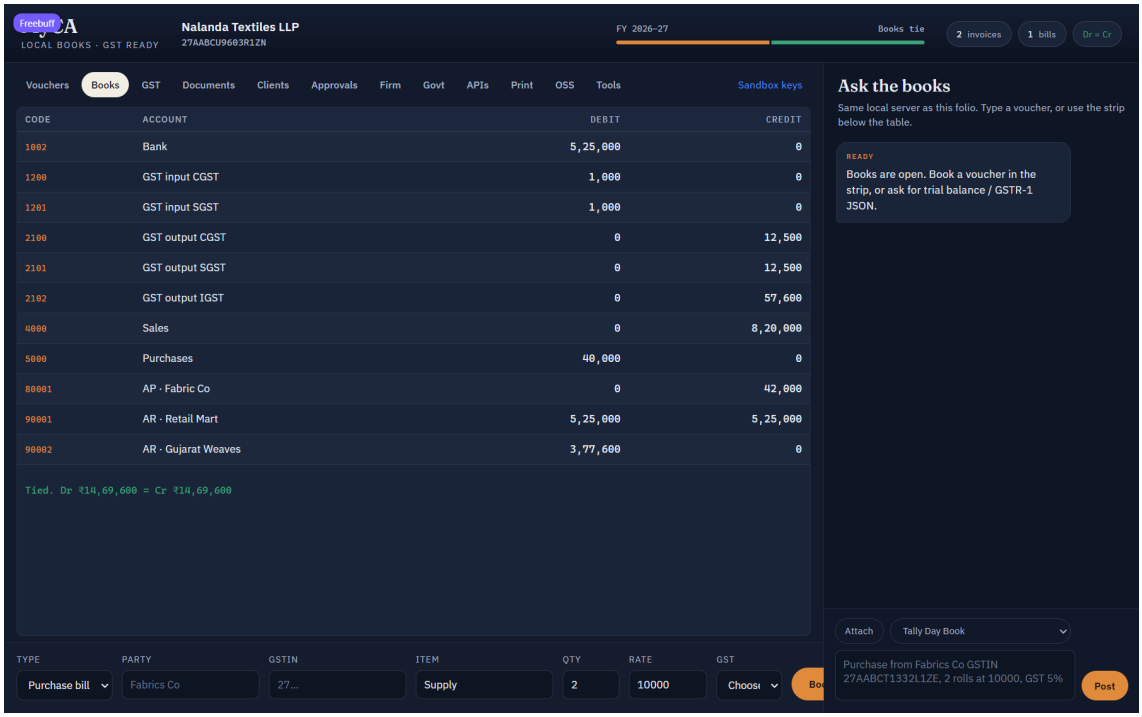

2 Every tab, captured live

Screenshots are 1440 × 900 captures of the running desktop with the seeded firm. Read each caption for what to point at in the room.

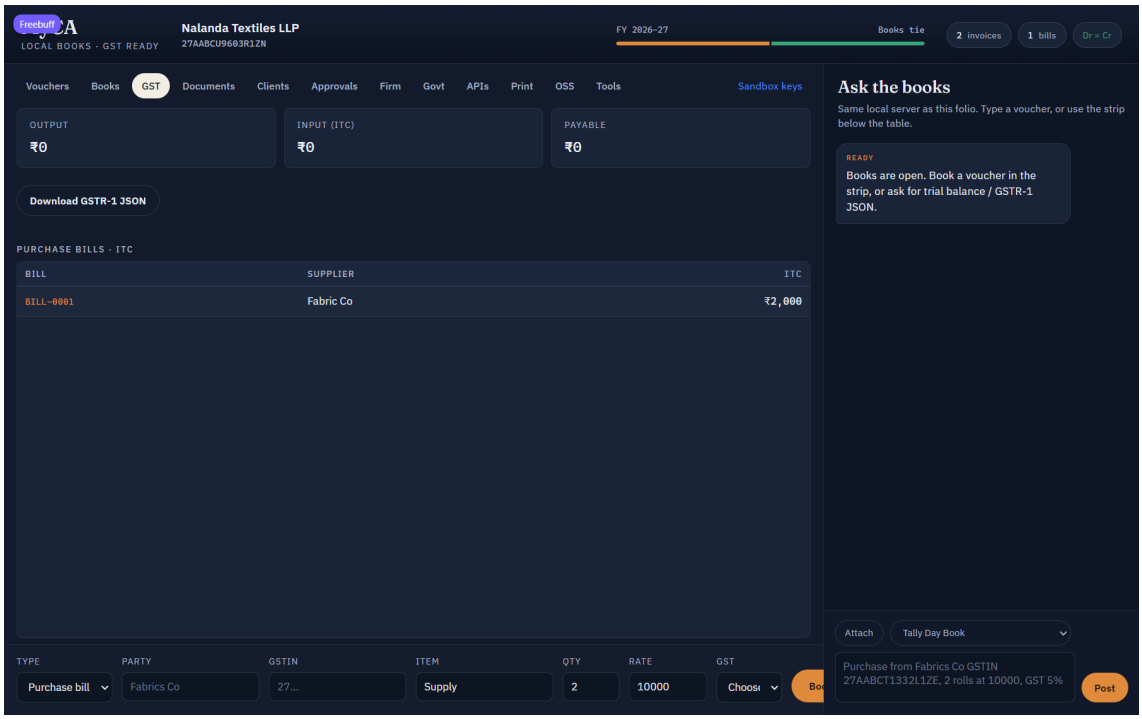

01 — Vouchers

The folio. INV-0002, BILL-0001 and INV-0001 (PAID) with party GSTINs and amounts; the strip below books a voucher; chat holds previews. Proves postings are visible, searchable and statused.

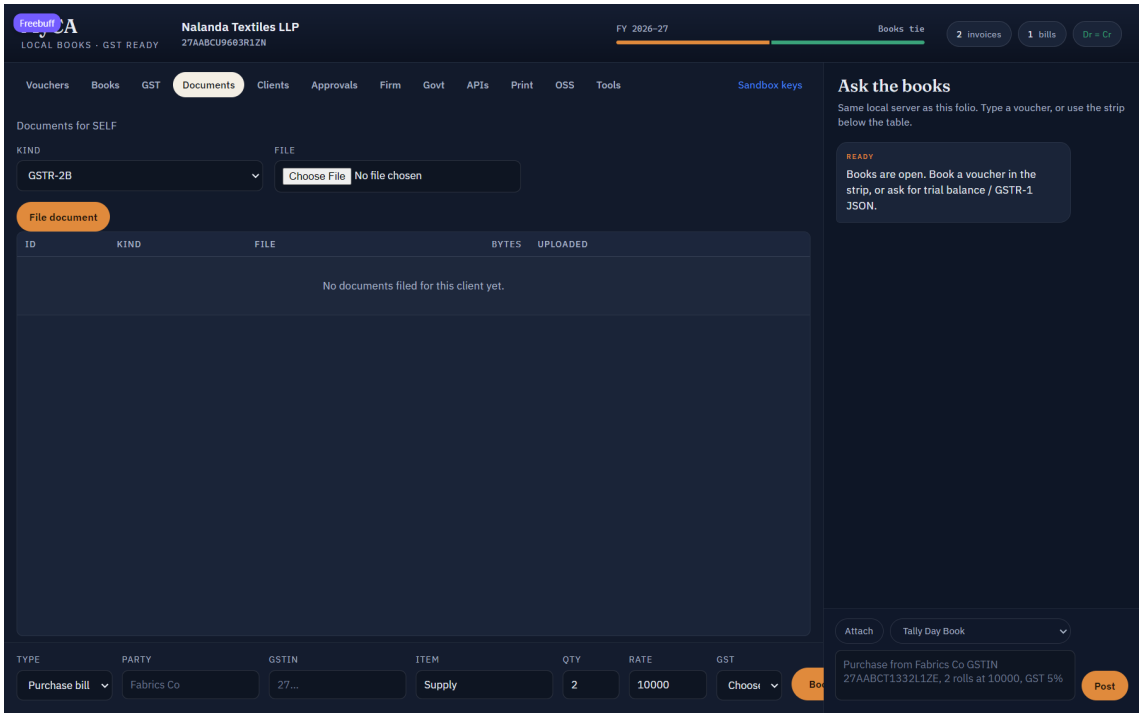

02 — Books

Chart of accounts with debit and credit columns and the tie line. Proves Dr = Cr from the same transfers that the vouchers show — ask for trial balance and read it here.

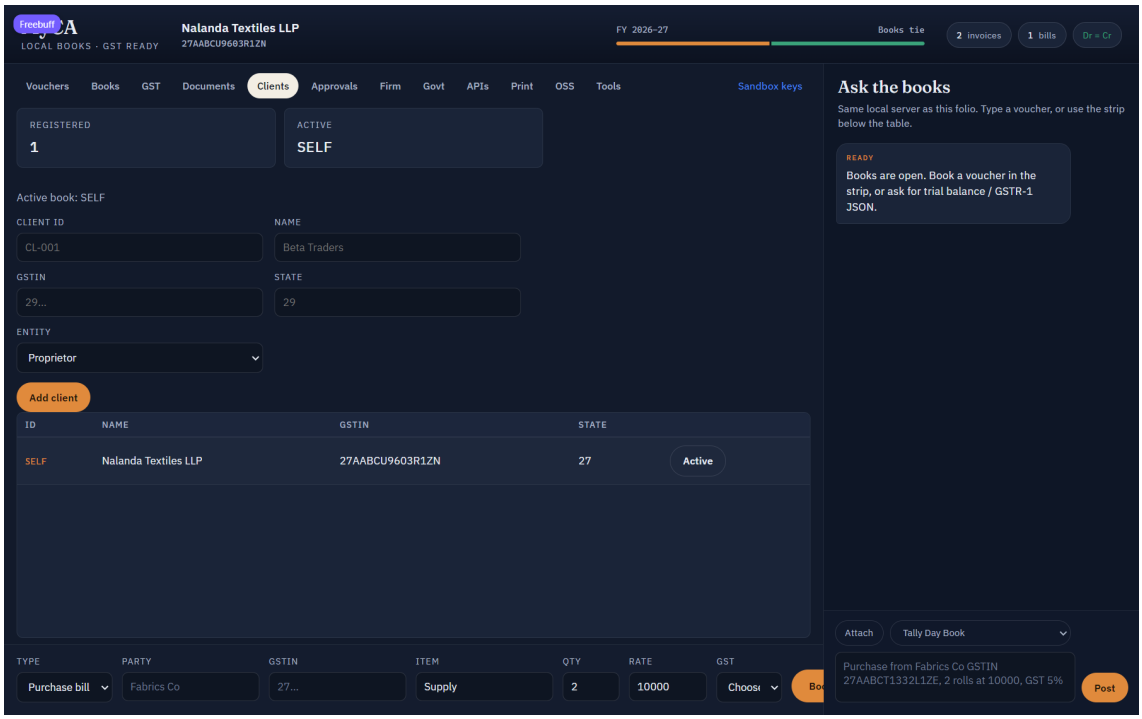

03 — GST

Return workspace: metrics, GSTR-1 download, purchase bills and ITC beside output tables. Proves the return is a projection of posted invoices, not a retyped form.

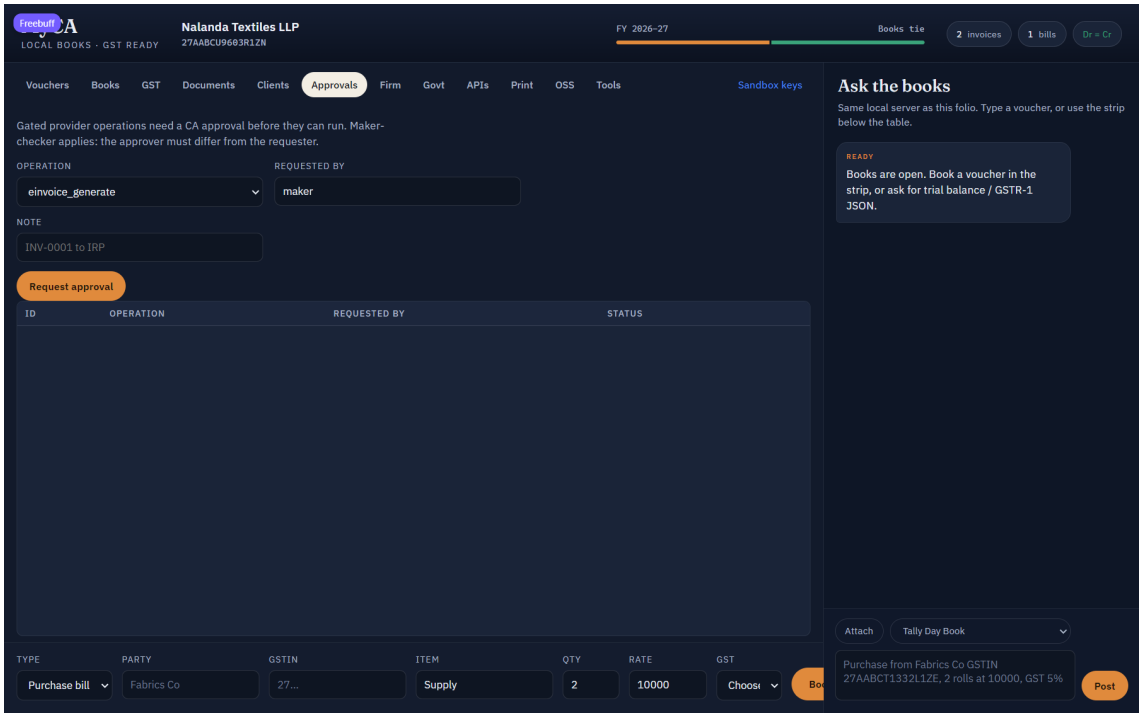

04 — Documents

File against the active client, list what is on file, download it back. Bytes are content-addressed and re-verified; state.json holds metadata only.

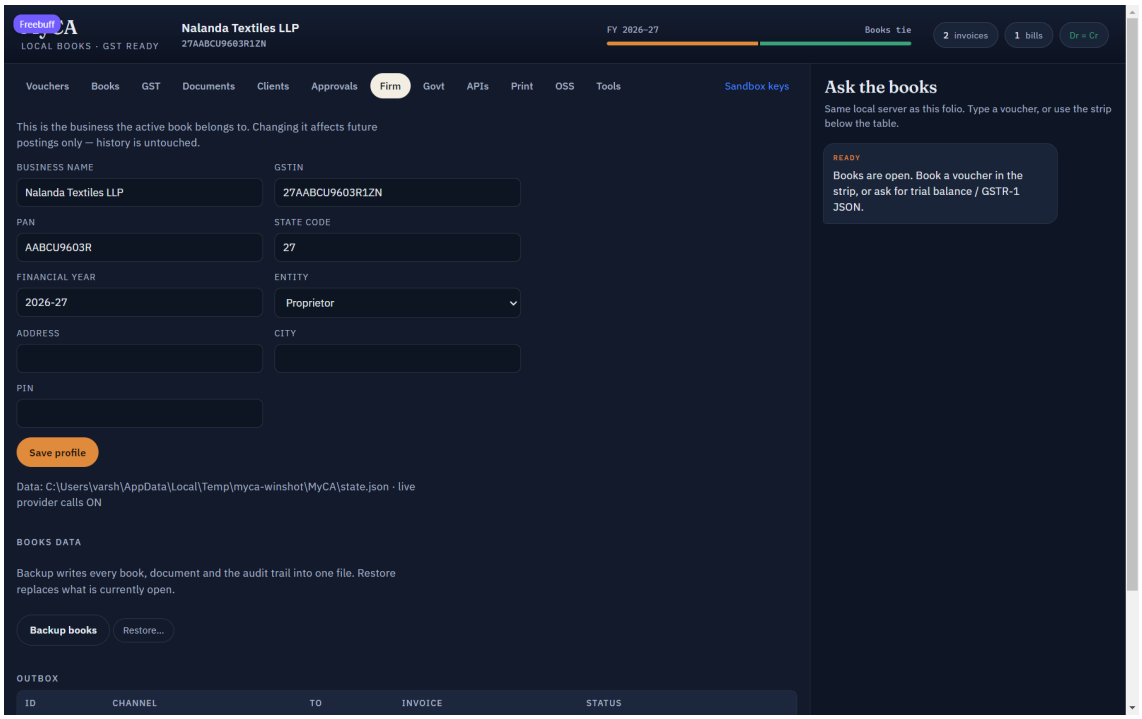

05 — Clients

Registry and active-book switcher. Each client gets isolated books; SELF is the firm's own. Proves multi-client practice without mingling ledgers.

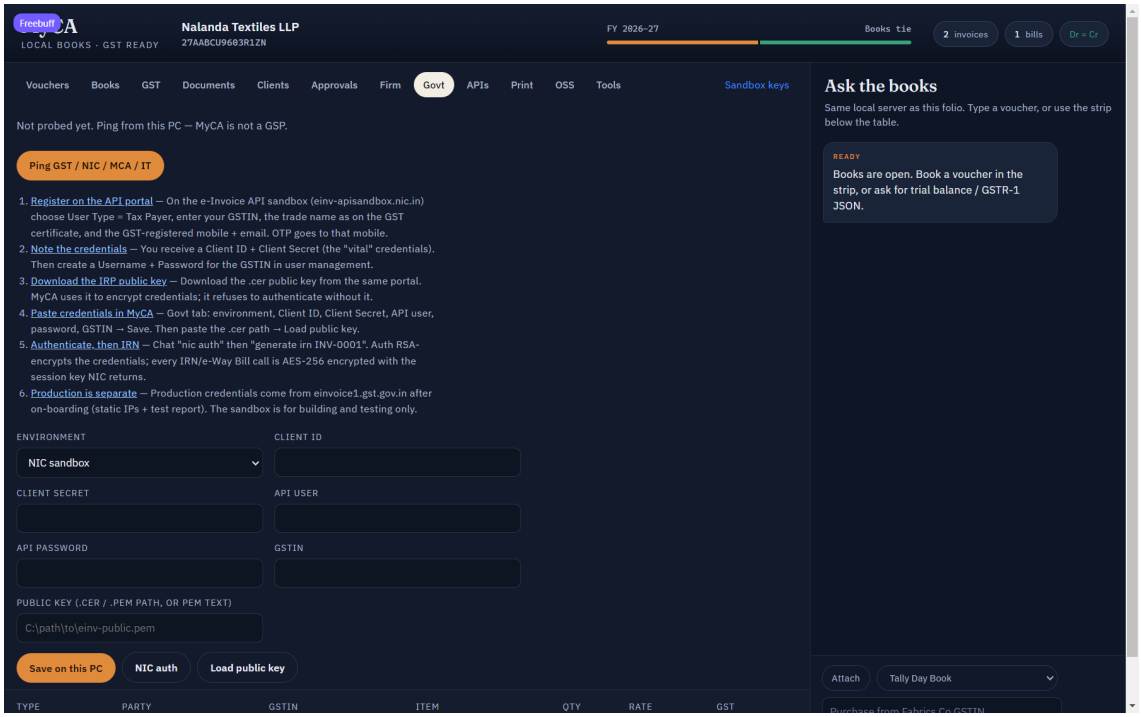

06 — Approvals

Request, review, approve or reject gated operations. Maker-checker, reviewer roles, 24-hour expiry, single use. The control CAs sign against.

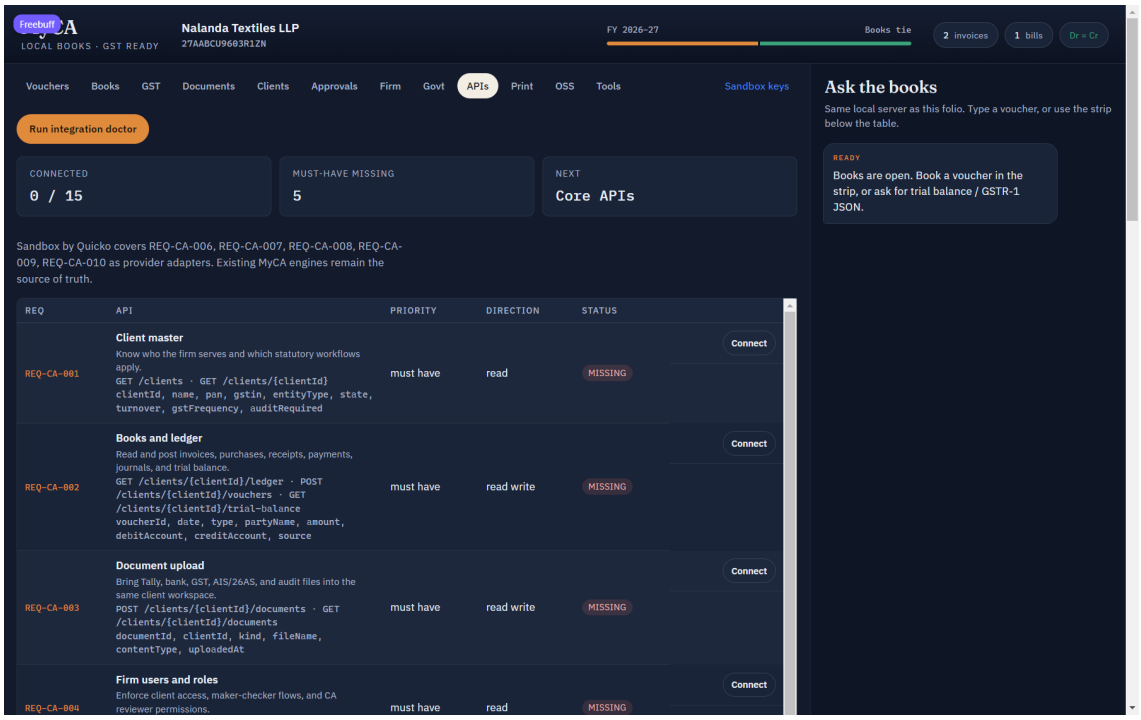

07 — Firm

Business profile (name, GSTIN, PAN, state, FY, entity), data path, backup / restore of every book and the audit trail, outbox. Changing identity affects future postings only.

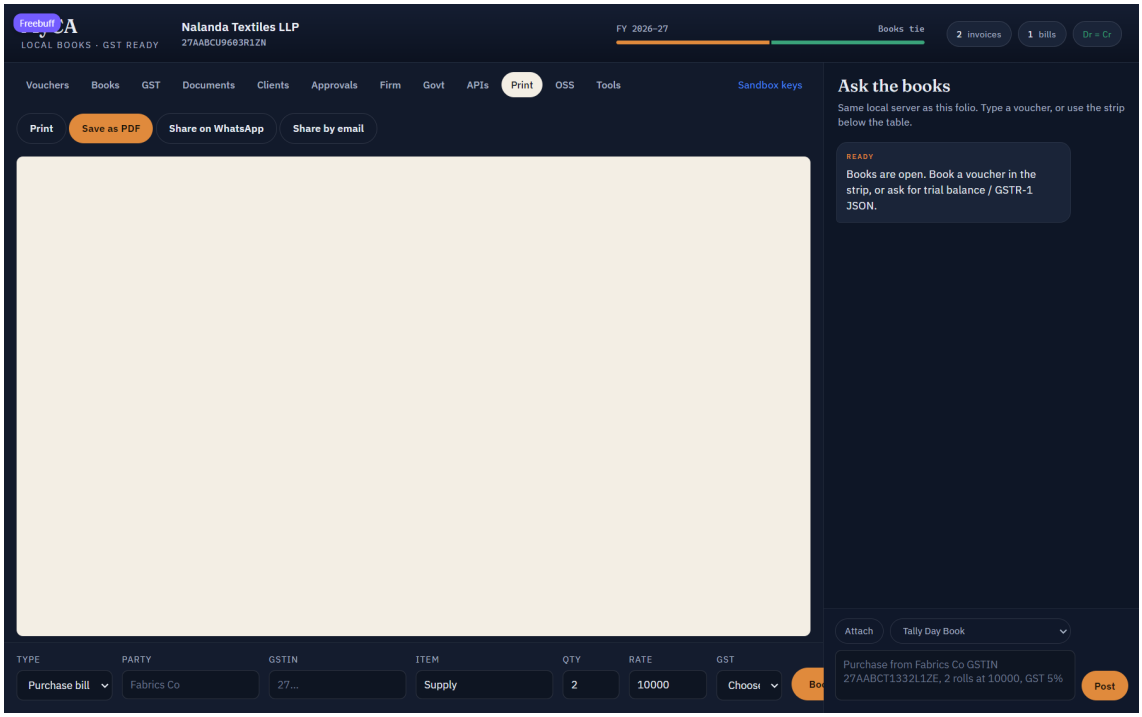

08 — Govt

NIC e-invoice on-boarding in six steps: portal registration, credentials, public key, save, auth then IRN, production separated. Refuses to authenticate without the .cer.

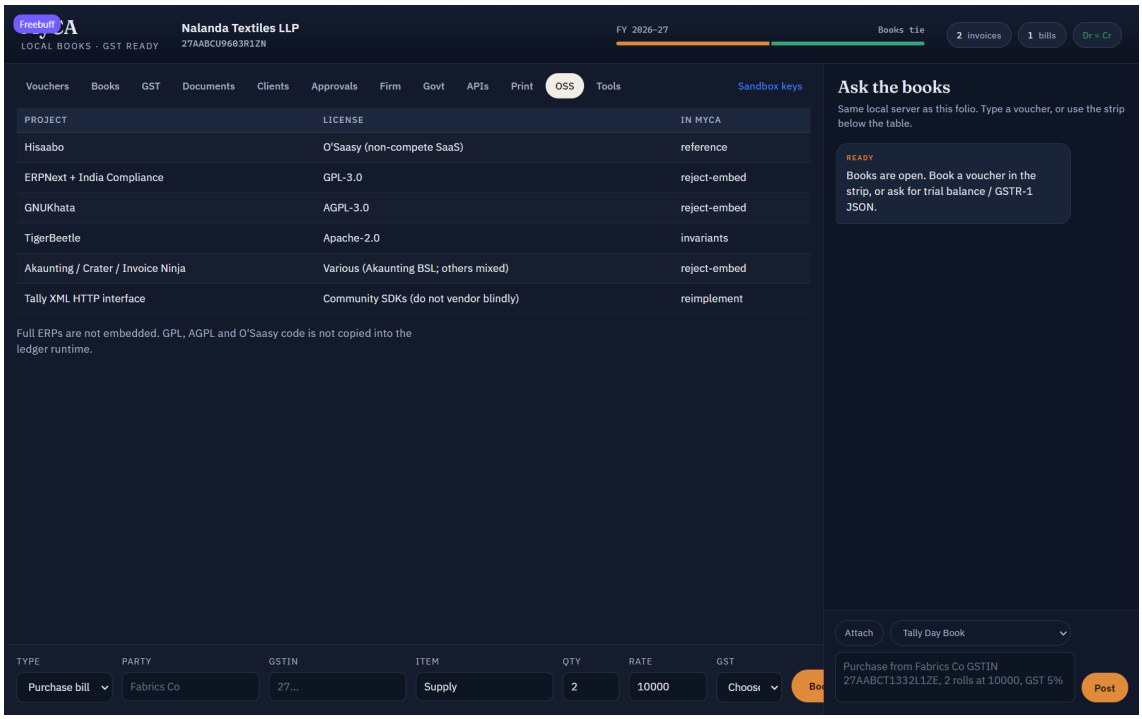

09 — APIs

Integration readiness REQ-CA-001…015: connected count, must-have missing, next step; Sandbox by Quicko as provider adapters with engines as source of truth.

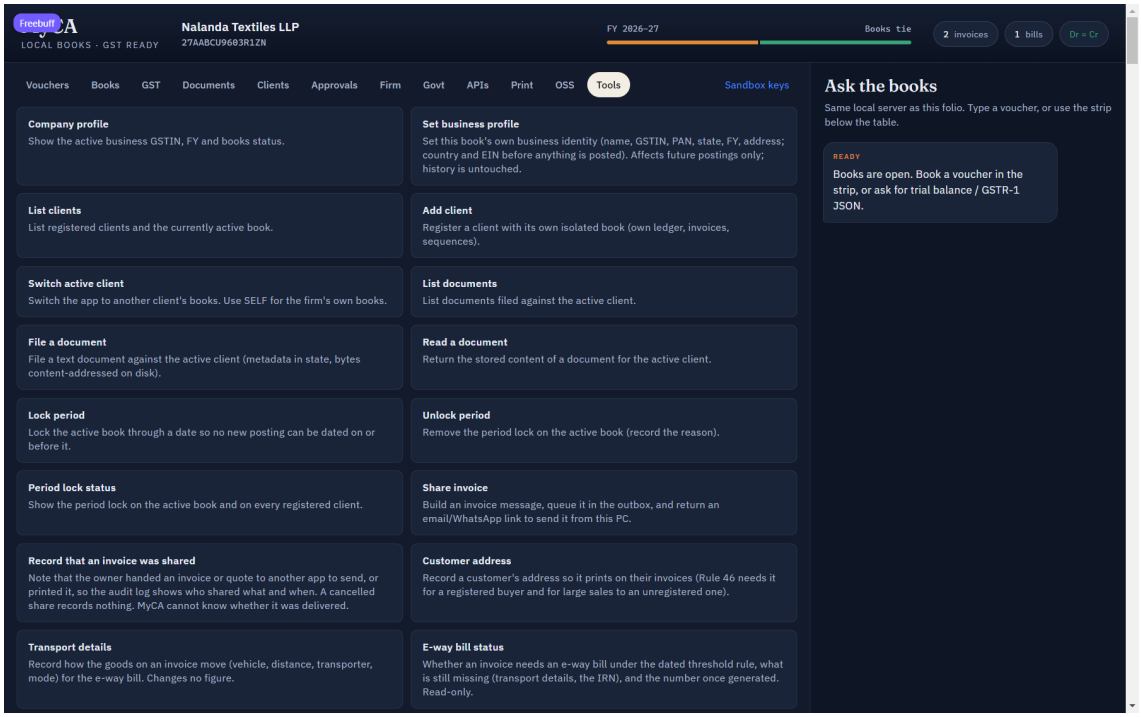

10 — Print

Invoice output: print, Save as PDF through the narrow preload bridge, WhatsApp and email share from this PC. Colour, bank details, terms, HSN, signatory.

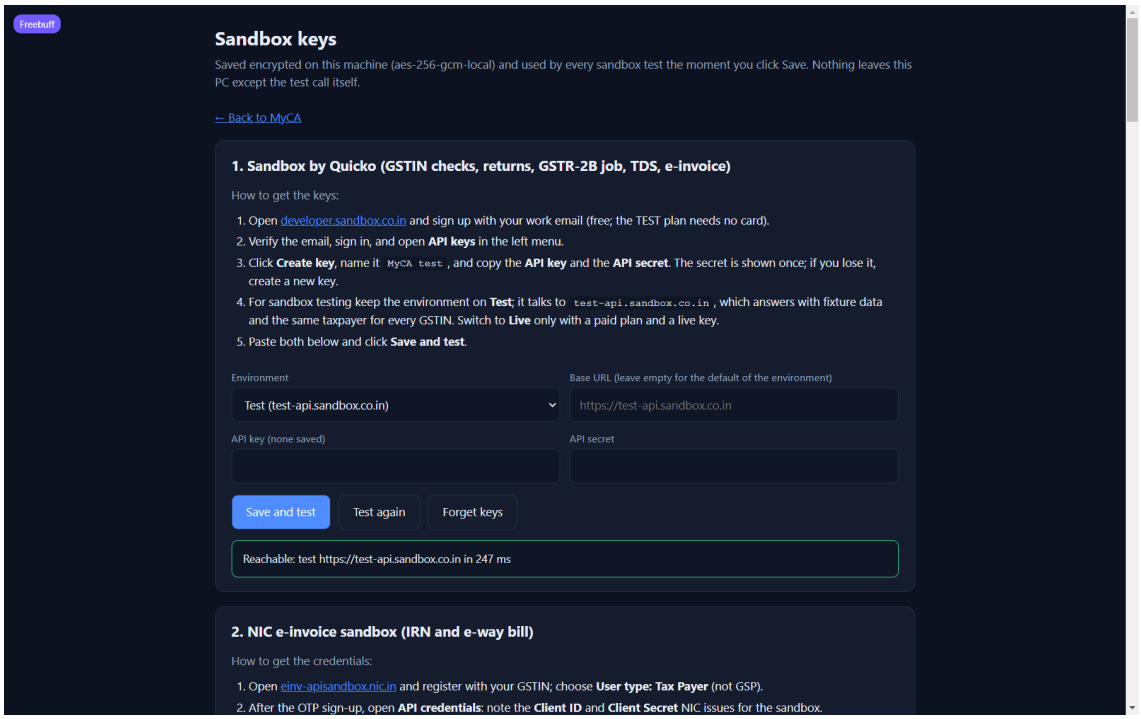

11 — OSS

Licence honesty table: what is referenced, reimplemented or refused to embed (GPL / AGPL / O'Saasy never copied into the ledger runtime).

12 — Tools

Named-tool catalogue with risk classes. Writes, credentials and approval decisions are blocked from the assistant; the chat may only choose, never compute.

13 — Sandbox keys

Keys beside the desktop: Quicko TEST vs LIVE with reachable check, and NIC sandbox credentials. Saved encrypted in the local vault; .env wins when set.

3 What to say when they push

- **Filing?** Prepared here, filed only with the live switch plus a bound approval; the acknowledgement returns to chat. No silent filing path exists.

- **GSP?** MyCA is not a GSP. Sandbox paths are verified in TEST; production needs on-boarding, static IPs and real keys.
- **Tally / Zoho?** Imports land without silent mapping; Tally push on this machine and Zoho push are gated writes. The ledger of record stays MyCA's journal.
- **AI figures?** The assistant chooses tools; every amount comes from a deterministic engine with act, section and dated validity.

Built from live captures on 30 Oct 2026 with seeded Nalanda Textiles LLP books. Figures are the demo books', not marketing.
